Professional Summary

- Aspiring in AI/ML with a strong academic foundation in Artificial Intelligence, Computer Vision, and Deep Learning, backed by hands-on project experience.
- Proficient in Python, TensorFlow, OpenCV, and Django with practical knowledge of building AI-powered tools and web applications.

Education

Parul University, Integrated Master of Computer Applications

June 2021 – Apr 2025

- CGPA: 8.90/10.0
- Gold Medalist (to be awarded) for securing the first rank in IMCA department, Class of 2021.
- **Specialization:** Artificial Intelligence

Projects

ShapeShift.AI - Transform text and image into 3D Reality

- Developed Web platform that generates 3D models from text and images using advanced AI tools.
- Implemented 3D model customization and export functionality in FBX, OBJ, and GLB formats, and integrated a scalable credit-based monetization system allowing users to generate 5 free models before purchase.
- Deployed Link: shapeshiftai.vercel.app

ClassiVision- Ease Model Training

- Created a browser-based web tool enabling non-technical users to create image classification models without prior Machine Learning knowledge, supporting dataset uploads of up to 1,000 images.
- Integrated real-time accuracy tracking to guide users toward achieving more than 85. model accuracy and enabled instant export of trained models in TensorFlow and TFLite formats
- Published at <https://classivision.streamlit.app/>

Yoga Pose Detector

- Developed a real-time Yoga Pose Detector using Python, TensorFlow, MediaPipe, and OpenCV, enabling accurate posture recognition via webcam input.
- Utilized OpenCV for live video capture and visualization, and MediaPipe for detecting key body landmarks and classifying yoga poses.
- Integrated a TensorFlow-based model to validate and provide feedback on user poses, enhancing accuracy and user guidance during yoga sessions.

Number Plate Detection using OpenCV

- Developed a Number Plate Detection system using OpenCV and Haar Cascade Classifier to identify vehicle plates from video frames in real time.
- Integrated OCR (Optical Character Recognition) to accurately extract alphanumeric plate data for automated logging.
- Implemented an Excel-based logging system to store and manage detected plate numbers for efficient record-keeping and tracking.

Technologies

Languages: Python, Java, HTML, CSS, JavaScript

Libraries: TensorFlow, OpenCV, Django, Flask, FastAPI, Pandas, BeautifulSoup, Excel

Database: MongoDB, MySQL, Firebase
